Design your team

Junlin Yuan · Spartan Agentic AI Studio

Your project

Build a team for a job
you actually want done

Life/work · something tedious/ambitious · public or made-up data

Don’t race it. Drive it.

Sorry: one more thing to learn. **It’s worth it.**

1. Be ambitious

Check and test

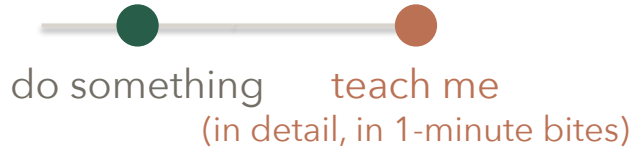

End to end

Larger scale

Grow with it

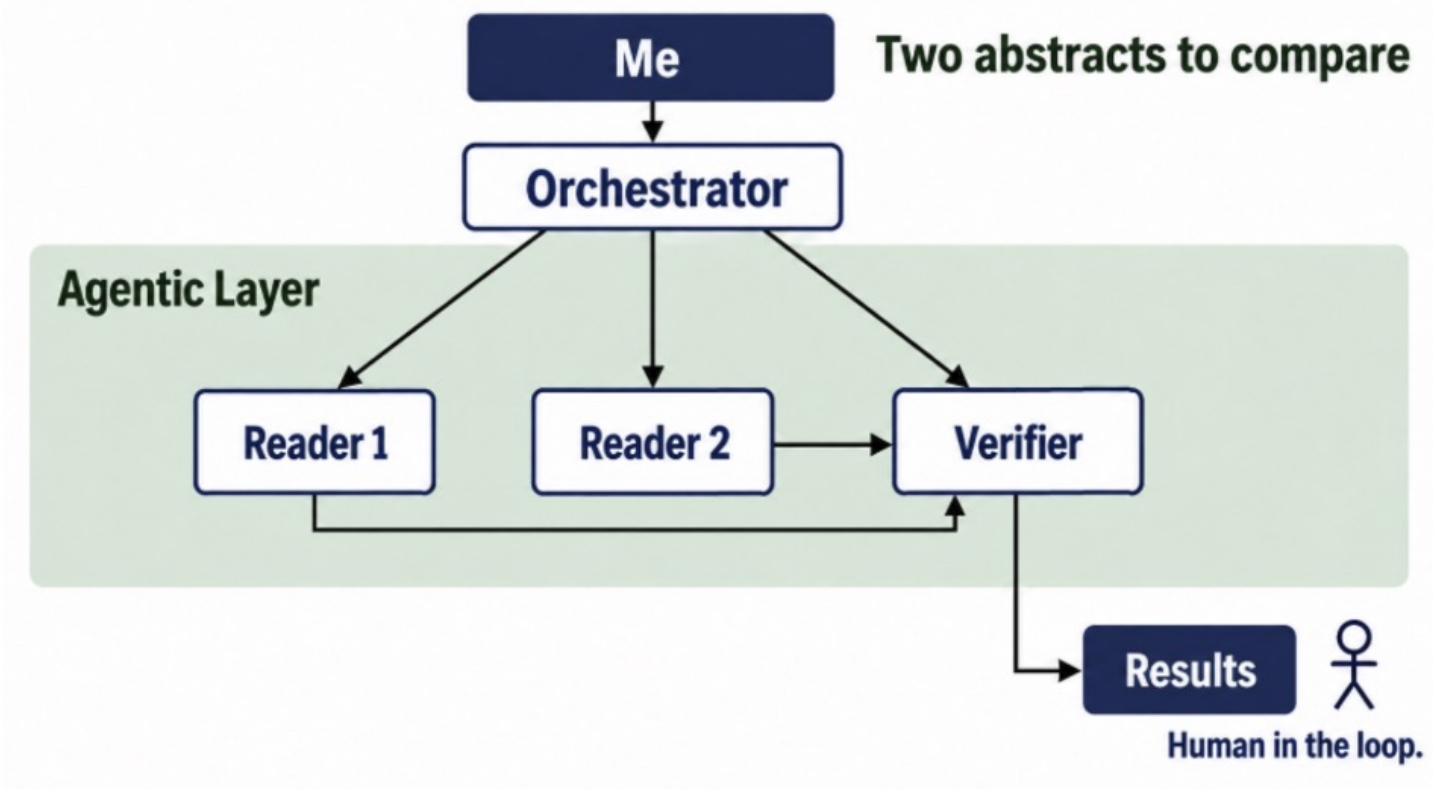

2. How many layers do you need?

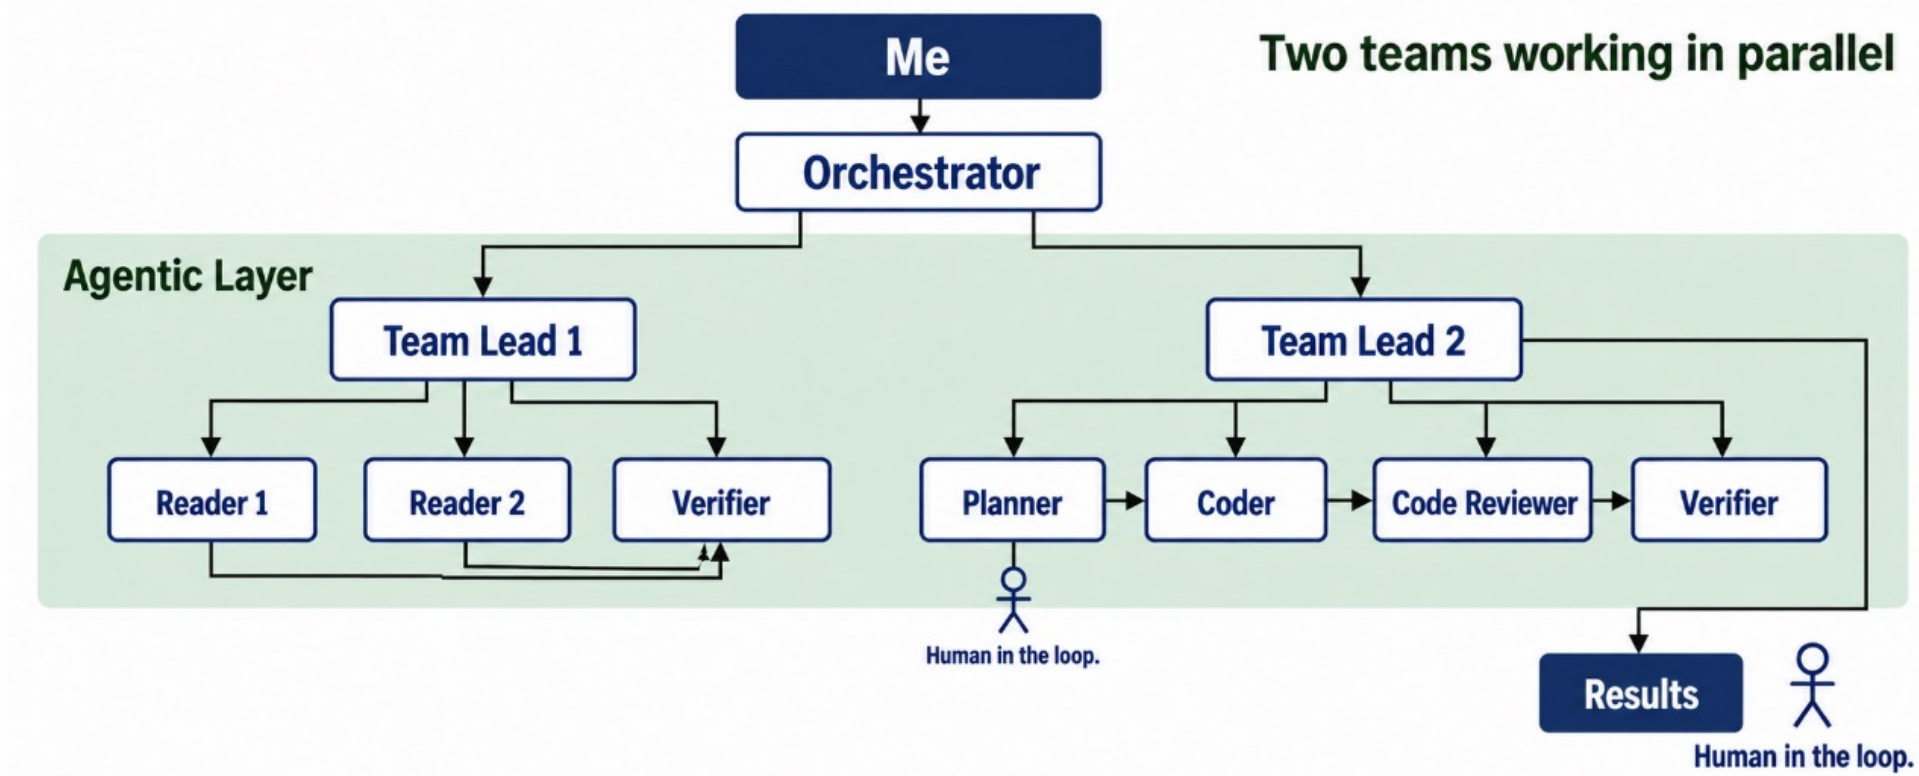

1 agent

2. How many layers do you need?

1 agent → 2 layers

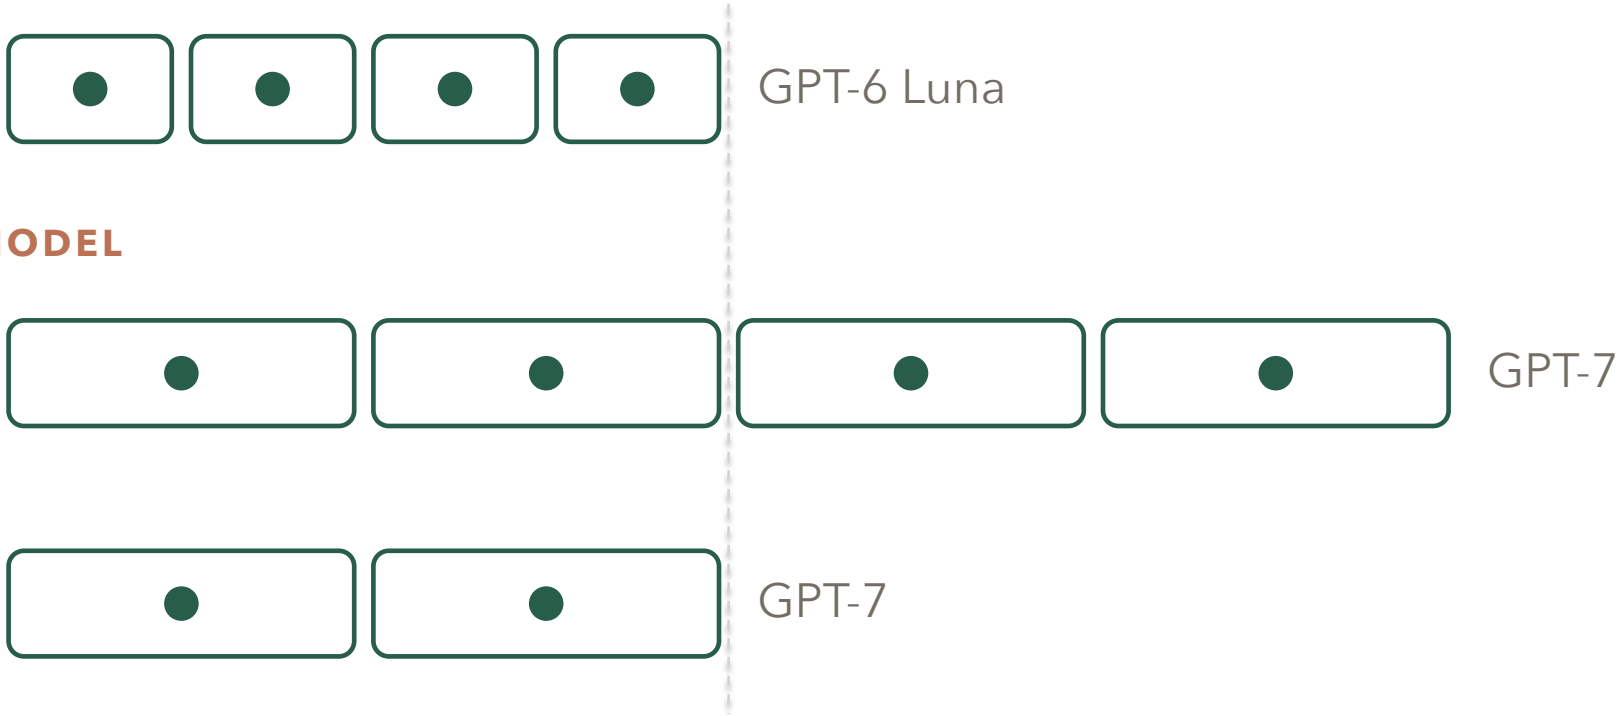

2. How many layers do you need?

1 agent → 2 layers → 3 layers

Stronger models, bigger roles

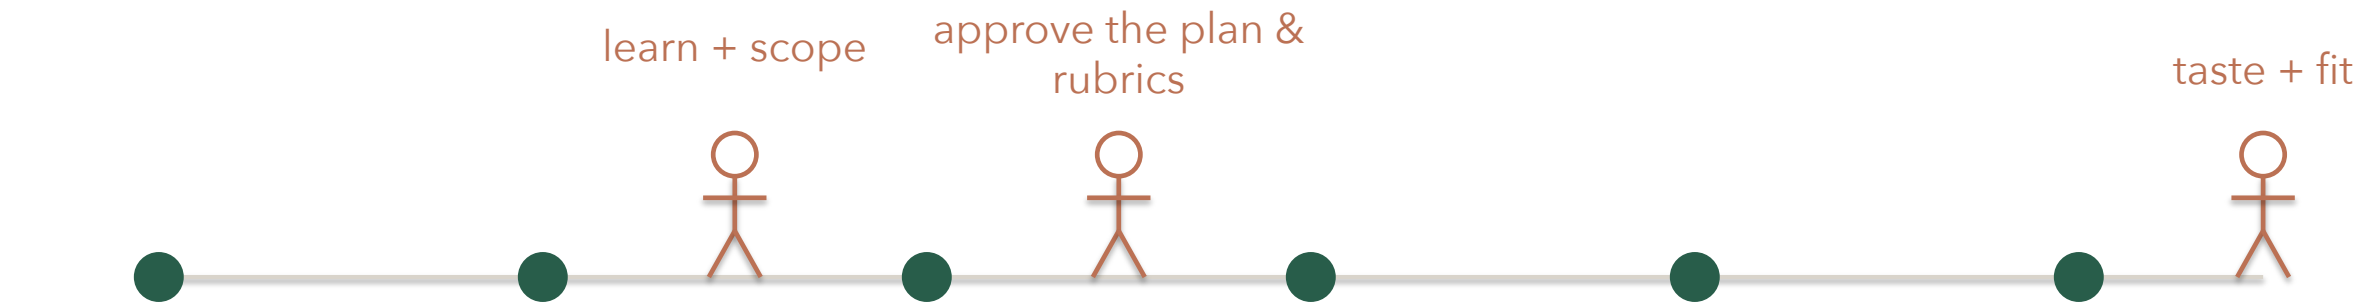

Every agent still earns its place

Bar: the job · each segment: one agent · dashed: today's job

3. Design yourself in (i.e. human-in-the-loop)

A garden plan for your balcony

Brainstormer
ideas for your balcony

Researcher
what makes a good small garden

Planner
writes the plan & rubrics

Finders ×4, parallel
compare 40 plants

Verifier
checks sun, size, care

Report writer
the garden plan

Designed in from the start

4. Steer the team, any time

Mid-run, on video 3's team

Message — the orchestrator takes it at its next step

@name — a fresh copy of a helper, for extra work

Start over — after N corrections that don't work (iterations are cheap)

The road from here

1

Pick a big job

too much to do by hand

2

Decide how to check

how you'll know it's done

3

Give it what it needs

skills, tools, sources

4

Ask what slows it

then fix it
